ABSTRACT:

CHG DATE=19990617 STATUS=O> The invention relates to a massaging sleeve (1) with tubular hollow chambers (2) which are made of an elastic material and have connections (3) for filling with a fluid. The hollow chambers (2) are arranged parallel to one another, overlap in an imbricated formation and, in the area of their narrow front sides (4), are in each case secured on a

common support (5).
Arrangements of this type tend to tear open in the front
area of the securing
of the hollow chambers (2) and thus become unusable.
According to the
invention, this should be prevented by virtue of the fact
that each narrow
front side (4) has a securing tab (6) whose free long side
(7) is secured on
the common support (5), the length of the securing tab (6)
preferably being
greater than the width of the hollow chambers (2). <IMAGE>
